POWERED BY
NATIONAL INSTRUMENTS
LabVIEW™

Tfn: +46 704 676 691

POWERED BY

LabVIEW.

With more than 20 years of experience with LabView® in personal computers (PC) it is natural that this will be the language in which all of the software will be developed in.

Development phase

The software will be developed in close collaboration with the end user after developing and agreeing upon a development plan. In this plan all the functions desired by the end user and their level of functionality should be stated and agreed upon. During this period preliminary versions of the program (Beta versions) will be tested by the end user to mold the functions as close as possible to the needs of the company and the end user. When the client and the developer agree that the software delivers all the functions and functionality stated in the development plan the current version of the software will be set and the development phase will end.

User phase

The software will be installed on the end user(s) computer(s). The client will pay a monthly license fee/license during the whole user phase. During this phase the client is entitled to software support delivered by the developer.

Functionality

The areas of the software functionality are among others system control (PID), data acquisition, data analysis, data mining, statistical analysis, report generation, all aspects of project control, cost control, cost reports, and many more.
